

Oil Sample Analysis and Interpretation

Regular sampling and analysis of oils, hydraulic fluids and heat transfer fluids provides a variety of benefits; *all of which save downtime and money:*

- Analysis tells you whether -
 - Fluid has become acidic
 - Fluid has been contaminated
 - Fluid has changed viscosity
 - Additives have been depleted
 - Fluid contains trace elements that indicate wear or potential failure

- Analysis provides the data required for knowledge-based decisions on lubricant life and change intervals, based on fluid condition - not the calendar.

- Technicians have the opportunity to observe, evaluate, repair or adjust machines when they are taking samples.

Pan American Lubricants provides sample kits, lab analysis and reports free of charge for all of our lubricating oils, hydraulic fluids and heat transfer fluids.
